

# The Three Pillars of Luminexis

A complete business framework covering what we offer, how we sell, and how we reach every blind and deaf-blind individual in India.

| PILLAR 1                                     | PILLAR 2                                                | PILLAR 3                                         |
|----------------------------------------------|---------------------------------------------------------|--------------------------------------------------|
| OFFER                                        | SALES                                                   | DISTRIBUTION                                     |
| What we give. What we solve. Why it matters. | How we find buyers. How we convince them. How we close. | How the product reaches the user. Every channel. |

## PILLAR 1

# THE OFFER

What we are giving. What problem we are solving. Why it exists.

## 1.1 The Problem We Solve

India has 12 million blind individuals and 5 lakh deaf-blind individuals. They face a daily reality that most people never think about — every moment of movement carries risk. An open drain on the pavement. A step down at a doorway. A pothole on a monsoon-soaked road. A vehicle approaching from the side. A person standing in the path. For every one of these hazards, a blind person in India today has one tool — the white cane — and it only tells them about what is directly in front of the tip.

The assistive products that exist either require a smartphone — adding dependency instead of removing it — or cost 3 to 5 lakh rupees, making them unaffordable for 95 percent of Indian users. A 2025 clinical study across five Indian rehabilitation centres found only 22.4 percent satisfaction with existing walking assistance products. The market is failing the people it is supposed to serve. Nobody has built a complete, standalone, offline, affordable system for the Indian environment. That is the exact gap Luminexis fills.

## 1.2 What Luminexis Offers

| PRODUCT                                         | WHO IT IS FOR                                                         | WHAT IT DOES                                                                                                                                                                                                    | WHAT MAKES IT UNIQUE                                                                                                                                                                |
|-------------------------------------------------|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smart Glasses Rs 25,000–35,000 (ADIP: Rs 8–12K) | Blind individuals of all ages. Works for partial and total blindness. | Detects objects, people, vehicles in real time. Warns about ground hazards. Turn-by-turn GPS navigation with offline maps. Malayalam, Hindi, Tamil, English voice. Integrated hearing aid for deaf-blind users. | Fully standalone — no phone, no internet. Only product in India with ground hazard detection and GPS navigation. Only product with Malayalam voice.                                 |
| Smart Band (Bundled with glasses)               | Deaf-blind users. Blind users who need ground-level hazard detection. | Ultrasonic, IR, and ToF laser sensors at wrist level detect holes, step-downs, wet surfaces. Haptic vibration communicates hazards to deaf-blind users. Fall detection with automatic SOS to caregivers.        | First product globally for deaf-blind navigation. Covers ground zone the glasses camera cannot see. 12-code haptic language learned in 5 minutes. Zero competitors in this segment. |

| PRODUCT                                | WHO IT IS FOR                                                              | WHAT IT DOES                                                                                                                                          | WHAT MAKES IT UNIQUE                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NeuraSpeech</b><br>(Research stage) | Blind AND speechless individuals. ALS, locked-in syndrome, cerebral palsy. | Non-invasive EEG headband reads brain signals when user thinks a word. AI decodes the thought. Glasses speak it aloud. No voice or movement required. | First product in the world for blind and speechless users. Science validated in 2025 peer-reviewed research. Completely uncontested market — zero competitors globally. |

### 1.3 The Five Value Propositions

|    |                                                                                                                                                                                                                                                                                                                                        |
|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | <b>INDEPENDENCE</b><br>The user needs nobody else to operate Luminexis. No family member to hold their smartphone. No internet subscription. No technical support. They put on the glasses, they walk, they are guided. This is the core promise — technology that removes dependency, not adds it.                                    |
| 02 | <b>INDIA-FIRST DESIGN</b><br>Luminexis is built for Kerala roads, not American sidewalks. It knows what an autorickshaw looks like. It warns about open drains. It speaks Malayalam. It works in the rain. It works in zero mobile signal. No other product was designed with the Indian blind user in mind.                           |
| 03 | <b>COMPLETE COVERAGE</b><br>The glasses see forward and above. The band senses the ground below. Together they cover every dimension of the physical environment. No other product covers both eye-level and ground-level hazards simultaneously.                                                                                      |
| 04 | <b>AFFORDABILITY</b><br>At Rs 25,000–35,000 retail, Luminexis is positioned below OrCam (Rs 3–5 lakh) and above Torchit (Rs 12,000 but phone-dependent). Through the ADIP government scheme, effective user cost drops to Rs 8,000–12,000 — making it the most affordable standalone assistive glasses product in India.               |
| 05 | <b>DIGNITY</b><br>The product looks like premium eyewear. There is no visible medical device, no clip-on module, no USB dongle hanging from a phone. Users report that products that make them look visibly disabled reduce adoption rates dramatically. Luminexis is designed to be worn with pride, not hidden out of embarrassment. |

# SALES

How we find our buyers. How we build trust. How we convert interest into purchase.

## 2.1 Who We Sell To — Three Buyer Types

| BUYER TYPE                | WHO THEY ARE                                                                                                                                              | HOW THEY DECIDE                                                                                                                                                                   | WHAT CONVINCES THEM                                                                                                                                                            |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Individual User (B2C)     | Blind individuals aged 15–65. Family members buying on behalf of a blind relative. Caregivers and NGO workers recommending to users.                      | Recommendation from another blind user or rehab specialist. Community trust (WhatsApp groups, NAB centres). Video of another blind person using it successfully.                  | User testimonial video. Free 7-day trial offer. Malayalam demonstration. ADIP scheme affordability. Seeing the ground hazard detection work live.                              |
| Institutional Buyer (B2B) | Schools for the blind (50–200 unit orders). Government hospitals and eye institutes. NGOs — NAB Kerala, Vision-Aid, Samarathanam. Rehabilitation centres. | Clinical validation data from pilot study. Certification — BIS, WPC. ADIP scheme listing (government procurement). Reference from another institution already using it.           | Pilot programme offer — free devices, documented outcomes. Clinical study results (LV Prasad Eye Institute). ADIP scheme listing certificate. ISO/BIS certification documents. |
| Government Procurement    | ADIP scheme under Ministry of Social Justice. State government disability welfare departments. NHFDC. District blind welfare offices.                     | ADIP scheme listing is the key unlock. Once listed, government buys and distributes at subsidised rates. Requires BIS certification, clinical validation, and pricing compliance. | ADIP empanelment application. BIS CRS certificate. Clinical trial data. Pricing within ADIP limits. Made-in-India certification.                                               |

## 2.2 Sales Strategy — Three Engines

| ENGINE 1 — COMMUNITY TRUST (Start Here)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>How it works:</b> Blind users do not buy from advertisements. They buy from recommendations within their community — other blind users, rehabilitation specialists, NAB centres, and family caregivers who have seen the product work. The first 500 units sold by Luminexis will come entirely from this engine.</p> <p><b>Tactics:</b> Free 10-person pilot at NAB Kerala rehabilitation centre. Document every user outcome with consent. Film the first blind user who navigates independently using Luminexis. Share in blind community WhatsApp groups across Kerala. Attend NAB rehabilitation workshops. Partner with CICS Calicut school for the blind — 350 students. Train one NAB rehabilitation specialist as a product champion.</p> <p><b>Why it works:</b> Trust within the blind community is extremely high. A recommendation from another blind user carries more weight than any advertisement. One viral video of a blind person navigating independently will generate more sales than a Rs 5 lakh marketing campaign.</p> |

## ENGINE 2 — INSTITUTIONAL B2B (Highest Revenue)

**How it works:** One institutional sale equals 50 to 500 units. A single partnership with a school for the blind, a government hospital, or an NGO generates more revenue than months of individual sales. This engine requires certification, clinical validation, and relationship-building that must start before commercial launch.

**Tactics:** Free pilot programme — we provide devices, institution provides users. Document clinical outcomes. Use outcomes to pitch next institution. Approach LV Prasad Eye Institute for clinical validation partnership. Apply for ADIP scheme empanelment — this unlocks government procurement at scale across India. Present at EMPOWER IIT Delhi conference annually.

**Why it works:** Institutions have procurement budgets. They buy in volume. Once a product is embedded in a school or hospital system, repeat orders come automatically. Government ADIP listing alone can drive thousands of units per year.

## ENGINE 3 — FOUNDER STORY (Brand + Investor Signal)

**How it works:** The founder story — young builder from Kozhikode, no factory, no lab, building technology for 12 million blind Indians — is itself a marketing asset. Journalists, investors, government officials, and potential partners all respond to this narrative. It costs zero rupees and builds awareness that paid advertising cannot buy.

**Tactics:** LinkedIn posts three times per week — founder journey, technical updates, impact stories. Pitch to YourStory, The Hindu, Mathrubhumi, NDTV Good Times. Apply to Qualcomm Design in India Challenge, BIRAC PACE, Social Alpha. Documentary brand video after first 10-person pilot. YouTube and Instagram with user testimonials and build updates.

**Why it works:** India deep tech ecosystem actively looks for social impact hardware founders. One national media story generates more credibility than years of cold outreach. Investor visibility through LinkedIn converts directly to funding conversations.

## 2.3 The Sales Funnel

| STAGE         | WHAT HAPPENS                                                                                                | HOW WE MOVE THEM FORWARD                                                                  | METRIC              |
|---------------|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|---------------------|
| AWARENESS     | Person learns Luminexis exists via social media, media coverage, community recommendation, or NGO workshop. | LinkedIn posts, Instagram Reels, WhatsApp shares, media articles, competition wins.       | 100,000 reached/yr  |
| INTEREST      | Person visits website, watches demo video, or asks someone who has used it.                                 | Website with waitlist. Demo video. FAQ in Malayalam and English.                          | 10,000 visitors/yr  |
| CONSIDERATION | Person or institution wants to know more — pricing, features, how to get it.                                | Free trial offer. Pilot programme for institutions. ADIP affordability information.       | 1,000 leads/yr      |
| PURCHASE      | Individual orders online or institution signs procurement order.                                            | Direct website order. Institutional procurement process. ADIP scheme application support. | 500 units Year 1    |
| ADVOCACY      | Happy user tells others. Blind community shares their story.                                                | Video testimonial programme. Refer-a-friend discount. Community champion programme.       | 50 active advocates |

# DISTRIBUTION

How the product reaches every blind and deaf-blind individual across India. Every channel. Every partner. Every stage.

## 3.1 Distribution Philosophy

A blind individual in Kerala does not browse Amazon and add a Rs 30,000 device to their cart. Distribution for Luminexis must be designed around how blind users actually access technology — through rehabilitation specialists, NGO workers, community networks, and government schemes. Physical demonstration is essential. A blind person must experience the product to understand its value. Digital-only distribution will not work. Our distribution model combines direct digital sales for urban users, NGO-mediated distribution for community users, and government scheme distribution for low-income users — three parallel channels operating simultaneously.

## 3.2 The Five Distribution Channels

| CHANNEL                        | HOW IT WORKS                                                                                                                                                                                                                     | TARGET USERS                                                                                                                     | VOLUME             | STAGE                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|--------------------|----------------------|
| 1. Direct Online (D2C Website) | User or family member orders from luminexis.in. Payment via UPI, card, or EMI. Delivered in 5–7 days with setup support call. Malayalam customer support.                                                                        | Urban and semi-urban blind users aged 20–50. Family members of blind individuals.                                                | 200 units Year 1   | Launch Month 1       |
| 2. NGO & Rehab Centres         | Luminexis partners with NAB Kerala, Vision-Aid India, and Samarthanam Trust as official distribution partners. They demonstrate, recommend, and facilitate purchase. Devices kept in stock at major centres for immediate trial. | Blind individuals who attend rehabilitation centres. Rural users who rely on NGO networks.                                       | 150 units Year 1   | Month 3 (post-pilot) |
| 3. Government ADIP Scheme      | Luminexis listed as approved device under ADIP scheme. Government purchases at approved price and distributes to beneficiaries at subsidised or zero cost. District social welfare offices handle last-mile delivery.            | Low-income blind individuals. Government welfare beneficiaries. School students in government blind schools.                     | 500+ units Year 2+ | Month 8 (post-cert)  |
| 4. Institutional B2B Direct    | Luminexis sales team approaches schools for the blind, eye hospitals, and rehabilitation institutions directly. Demo visit. Pilot offer. Procurement negotiation. Bulk pricing for 50+ unit orders.                              | Schools for the blind (350+ students each). Eye hospitals with outpatient rehab programmes. Corporate CSR disability programmes. | 300 units Year 1   | Month 2 (ongoing)    |
| 5. Amazon India & Flipkart     | Listed on Amazon India under Assistive Technology category. BIS certification required. Fulfilled by Luminexis. Product listing in Malayalam and English. Customer questions answered within 2 hours.                            | Tech-savvy family members searching online. Caregivers who discovered Luminexis through media.                                   | 100 units Year 1   | Month 6 (post-BIS)   |

### 3.3 Last-Mile Distribution — Reaching Rural Kerala

More than half of India's blind population lives in rural areas where internet access is limited, awareness of assistive technology is low, and trust in unknown products is minimal. Reaching these users requires a physical presence strategy built around trusted community institutions.

| APPROACH                          | DETAIL                                                                                                                                                                                                                                                                |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rehabilitation camp model         | Partner with NAB Kerala, district hospitals, and Panchayat disability cells to run monthly product demonstration camps in Tier 2 and Tier 3 towns across Kerala. Bring a device. Let blind individuals try it. Take orders on the spot. Deliver within 2 weeks.       |
| Village-level community champion  | Identify one trained Luminexis user in each district — someone who can demonstrate the product and assist new users. Compensate with commission on referred sales. This mirrors how Jio agents expanded mobile internet in rural India.                               |
| Post office network partnership   | India Post has the deepest last-mile reach in the country, including in villages with no courier service. Partner with India Post for delivery to rural pin codes. Payment collection via India Post cash-on-delivery.                                                |
| Anganwadi and ASHA worker network | These community health workers visit every household in India. Train select workers to identify blind individuals and introduce Luminexis through the government disability welfare network. This costs zero and reaches populations that no e-commerce platform can. |

### 3.4 Distribution Rollout Timeline

| PHASE                   | WHEN        | CHANNELS ACTIVE                                                                         | TARGET UNITS       |
|-------------------------|-------------|-----------------------------------------------------------------------------------------|--------------------|
| Phase 1 — Kerala Launch | Month 1–6   | D2C website + Institutional B2B + NAB Kerala partnership                                | 250 units          |
| Phase 2 — Kerala Scale  | Month 6–12  | Above + Amazon India + ADIP empanelment application + rural camps in 5 Kerala districts | 500 units total    |
| Phase 3 — South India   | Month 12–18 | All above + Tamil Nadu NGO partnerships + Karnataka distribution + Andhra Pradesh pilot | 1,500 units total  |
| Phase 4 — National      | Month 18–36 | All above + ADIP scheme national listing + pan-India NGO network + Amazon + Flipkart    | 5,000+ units total |

### **The Three Pillars — Working Together**

The Offer defines what we build and why it matters. The Sales strategy defines how we find buyers and build trust. The Distribution network defines how the product physically reaches every blind and deaf-blind individual in India regardless of where they live or how much they earn.

These three pillars are not separate functions. They are one integrated system. The Offer is so compelling it sells itself when demonstrated. The Sales engine builds the trust to get to that demonstration. The Distribution network ensures that demonstration can happen in a village in Wayanad just as easily as on MG Road in Kozhikode.

**Built from Kerala. Built for India. Built for 12 million people who have been waiting for this.**
